Philips – Healthcare Consultancy Service
Best, Netherlands

Dear Hiring Manager,

I am applying for the Intern AI Application Developer position in the Healthcare Consultancy Service team. The role asks for AI tools that non-technical colleagues can pick up and rely on, delivered as something pilotable rather than a proof of concept. Most of what I have built during my studies fits that description, and it is the work I want to do more of.

Philips is a company whose values I share, and visiting the Philips Museum in Eindhoven made that even more concrete: more than a century of reinventing what it makes, from light bulbs to health technology. At BrabantHack 2026 I also saw the Brainport ecosystem that grew around Philips, and I want to work for a company that builds for the long term.

In a two-person sprint I built a self-hosted RAG assistant that answers event questions from a client's confidential documents through a Gradio web interface; the client deployed it to production. Reliability came from constraining the model rather than trusting it: answers are drawn only from retrieved context, each is returned with its source passages and their relevance, and the assistant says so explicitly when the documents do not cover a question.

On a five-person platform project I owned deployment and CI/CD for a FastAPI and Next.js application: one codebase shipping to Docker Compose, on-premise Portainer and Azure Container Apps, with blue-green cutover, health-gated rollback, an 85% coverage gate and 430 tests. Separately, I wrote a real-time sign-language trainer end to end on my own, from the PyTorch models to a FastAPI WebSocket backend and a bilingual Next.js frontend.

The consultancy side of the role matches my current project. As data engineer on the Measurement Trust Project, I work on inconsistent item measurement at bol's fulfilment centres BFC1/2, which bol owns and CEVA Logistics operates. Much of the work so far has been with people rather than code: obtaining partly anonymised data from both CEVA and bol, working with Logistore and other third parties, writing business requirements documents, and keeping proposals compliant with GDPR and ethics requirements while making them understandable to non-technical stakeholders.

I should be clear that I am a third-year Bachelor's student (9.1/10, scholarship), not the Master's student the posting describes, and would ask you to weigh that against a record of shipping working systems to real users.

I am available from beginning of 2027 for 6 month, 40 hours per week, and can work from the Best office up to 5 days a week.

I would welcome the chance to discuss how I could contribute to the team. Thank you for your time and consideration.

Kind regards,

Oleksii Krasnoshtanov
