ASML, Virtual Computing Platform team
Veldhoven, Netherlands

Dear Hiring Manager,

I am applying for the AI | Computer Science internship on AI-driven software quality in the Virtual Computing Platform team (job ID J-00352656). I am a third-year student in Applied Data Science and Artificial Intelligence at Breda University of Applied Sciences.

I am highly passionate about ASML. Its work and research allow the world to develop the most advanced technology we have, and I find the research behind the company amazing. I want to grow my career in AI, and ASML is where I would most like to do that.

I like that this assignment is practical. Working with software and test engineers to find where AI can help, building prototypes and agents, and measuring whether they make a real difference is the kind of work I enjoy most. Software quality is also something I already pay attention to in my own projects.

On a five-person platform project I owned deployment and CI/CD, with an 85% coverage gate, 430 tests, blue-green cutover and health-gated rollback. The platform also tracked drift in confidence, latency and error rate, and retrained the model based on researcher feedback on flagged predictions. Finding problems early and feeding them back into the system is the part of that project I would most like to build on.

I also have hands-on experience with LLMs. In a two-person sprint I built a self-hosted RAG assistant with Llama 3.3 70B, LangChain and FAISS, and the client deployed it to production. It answers only from retrieved documents, shows the sources behind each answer, and says clearly when the documents do not cover a question. I think the same idea is important for AI that assesses software issues: engineers need to see where a conclusion comes from before they can trust it.

My current project gives me practice with the stakeholder side. As data engineer on the Measurement Trust Project with CEVA Logistics and bol, I work with several companies to get access to their data, help write business requirements documents, and make sure our proposals are clear to non-technical stakeholders.

I work mainly in Python and use TypeScript for web frontends. I live in Tilburg, so two days a week on site in Veldhoven is easy to arrange. I am available full-time for six months from the beginning of 2027.

I would be happy to talk about how I could contribute to your team. Thank you for your time and consideration.

Kind regards,

Oleksii Krasnoshtanov
